

Annual Document Processing Report

Prepared by the Data Operations Team | October 2026

1. Introduction

Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block.

2. Methodology

Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block.

3. Challenges

Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block.

Multi-column layouts and mixed content such as tables, charts and equations make naive top-to-bottom text extraction produce scrambled output. Reading order must be reconstructed.

4. Observations

Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block. Modern organisations receive documents in many shapes: scanned invoices, research papers, spreadsheets and slide decks. Extracting reliable data from them requires understanding layout, reading order and the type of each content block.

5. Results

Table 1 summarises processing results for each document type tested during the year.

Document Type	Pages	Accuracy (%)	Avg. Time (s)
Digital PDF	1,200	98.4	1.2
Scanned Invoice	860	93.1	3.8
Research Paper	540	95.7	2.9
Spreadsheet	300	99.2	0.8
Presentation	410	96.0	2.1

Table 1: Processing results by document type

6. Evaluation Metric

We evaluate extraction quality using the F1 score, defined as the harmonic mean of precision and recall:

$$F_1 = 2 \cdot \frac{Precision \cdot Recall}{Precision + Recall}$$

7. Trend

Figure 1: Extraction accuracy by quarter

8. Conclusion

Accuracy improved steadily across all four quarters. Low-confidence regions should be flagged for human review rather than guessed, ensuring every extracted value remains verifiable against its original location in the document.
